Explain what is meant by the differential coefficient of any expression, and find the differential coefficients of  $-x$ ,  $\log(\tan a)$ ,  $\log(vx+a + /x+b)$ . See Williamson s Differential Calculus, 7; Todhunter s Differential Calculus, 24. The differential coefficients required may be easily worked from first principles; but the ordinary method is the shortest, thus:  $-d \log \tan x = d \tan x \sec^2 x / \tan^2 x = -n(n-1) \cdot (M-r+1)(l+ ) - , \therefore f(0)=n(n-l) \cdot (n-r+1)$ . Hence This series terminates at the  $(n+1)$ th term, if  $n$  is a positive integer; otherwise it has an infinite number of terms. For the second example see Williamson s Differential Calculus, 60. 4. Explain the method for finding the maxima and minima values of a function of  $x$ , and show how they are distinguished from each other. See Todhunter s Differential Calculus, 211; Williamson s Differential Calculus, 138. 5. Find the maxima and minima values of  $-----$ , and  $J ar+a?.a$  This may also be shown by examining the sign of the second differential coefficient when  $x=a(-1+ s/ 2)....$
